## Contents

<b>A: Level 2 Model and Performance</b> .....	3
<b>B: Metallurgical Issues</b> .....	6
<b>C: Modeling Issues</b> .....	9
<b>D: Software Engineering Issues</b> .....	14
<b>E: Next-Generation Level 2 System</b> .....	16

## A. Level 2 Model and Performance

---

### 1 Level 2 Model Development in Metal Pass

- **Rolling Process Models**
  - Flow stress, Force, ...
  - Roll deformation (flattening, deflection, crown, ...)
  - Steel deformation (width, draft, shape defects, ...)
  - Temperature, Heat transfer, ...
  - Material Properties, ...
- **Level 2 System (Model, Tracking, Data storage,...)**
- **Level 3 System (Production scheduling, Rolled steel properties prediction, Slab selection)**
- **Examples**
  - Over 100 empirical models, and FEM/FDM models
  - Steel Mill Resources (over 40,000 pages in [metalpass.com](http://metalpass.com))
  - 108 mill-related projects ([metalpass.com/consulting](http://metalpass.com/consulting))

## A. Level 2 Model and Performance

---

### 2 Error Ranges of Selected Level 2 Models

Error Range	Records Count		
	N. Steel	OSM_old	OSM_new
< 5%	30% (est.)	57%	80%
< 10%	75%	87%	90%
< 15%	80-90%	94%	99%

- 1) Data here are based on the troubled grades with shape problems in the past
- 2) OSM data here are before the 2<sup>nd</sup> improvement (for small strain, hold, etc.)

## A. Level 2 Model and Performance

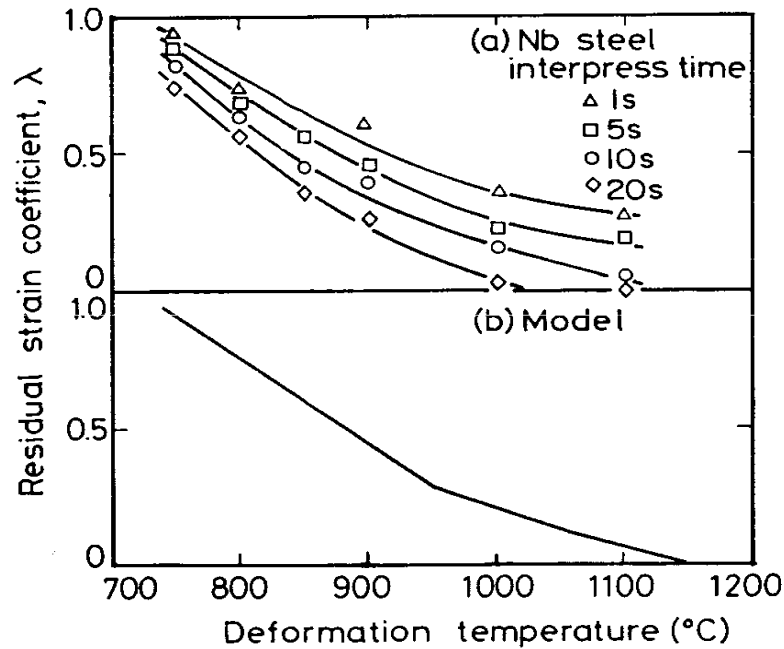

### 3 Benefits from 10% force error reduction

Item	Value	Annual Total (US\$)	Annual Saving (US\$)	Assumption
Investment Saving <sup>1)</sup>	15%	20,000,000	3,000,000	Equip. life 40 years
Slab grade saving <sup>2)</sup>	1%	400,000,000	4,000,000	50% of sales price
Energy Saving <sup>3)</sup>	3%	40,000,000	1,200,000	5% of sales price
Yield increase	1%	800,000,000	8,000,000	1% yield increase
Mill test saving for new products <sup>4)</sup>	45%	4,000,000	1,800,000	0.5% of sales price
<b>Total</b>			<b>18,000,000</b>	

- 1) The saving is based on the increase of equipment utilization of 10%.
- 2) When significant force error occurs, higher grade of steel has to be scheduled for an order to guarantee the rolled steel properties.
- 3) The increase of energy consumption due to higher grade scheduled.
- 4) Some plants conduct mill trial-and-errors for scheduling of new products.
- 5) Data in the table are based on a mill with US\$800 million equipment and US\$800 million annual sales.

## B. Metallurgical Issues

### 1 Retained strain for the rolling

T(°C)	1000	900	850	800	750
T(°F)	1830	1650	1560	1470	1380
IT (%)	2	25	35	55	70
BL (%)	0	15	21	33	42

\* Nb steel, with inter-pass time:  
I. Tamura (IT) 20s  
B. Li (BL) 30-40s

## B. Metallurgical Issues

### 2 Possible entry into two-phase region

## B. Metallurgical Issues

---

### 3 Other Metallurgical Issues

- **Resume Pass after Hold**
  - Steel strength change during hold
  - Most resume passes have 20-40% force error if no correction occurs
  
- **Grain size vs. Flow stress**
  - Change of grain size affects flow stress
  - Phase change affects temperature

## C. Modeling Issues

---

### 1 Problem 1: Flow stress equation and learning (old)

$$\sigma = C_1 e^{C_2/T} \cdot \epsilon^{C_3} \cdot u^{C_4}$$

Fit	Learning Coefficient	Fixed Coefficient
FIT2	C1, C2	C3=0, C4=0
FIT3A	C1, C2, C3	C4=0
FIT3B	C1, C2, C4	C3=0
FIT4	C1, C2, C3, C4	

## C. Modeling Issues

---

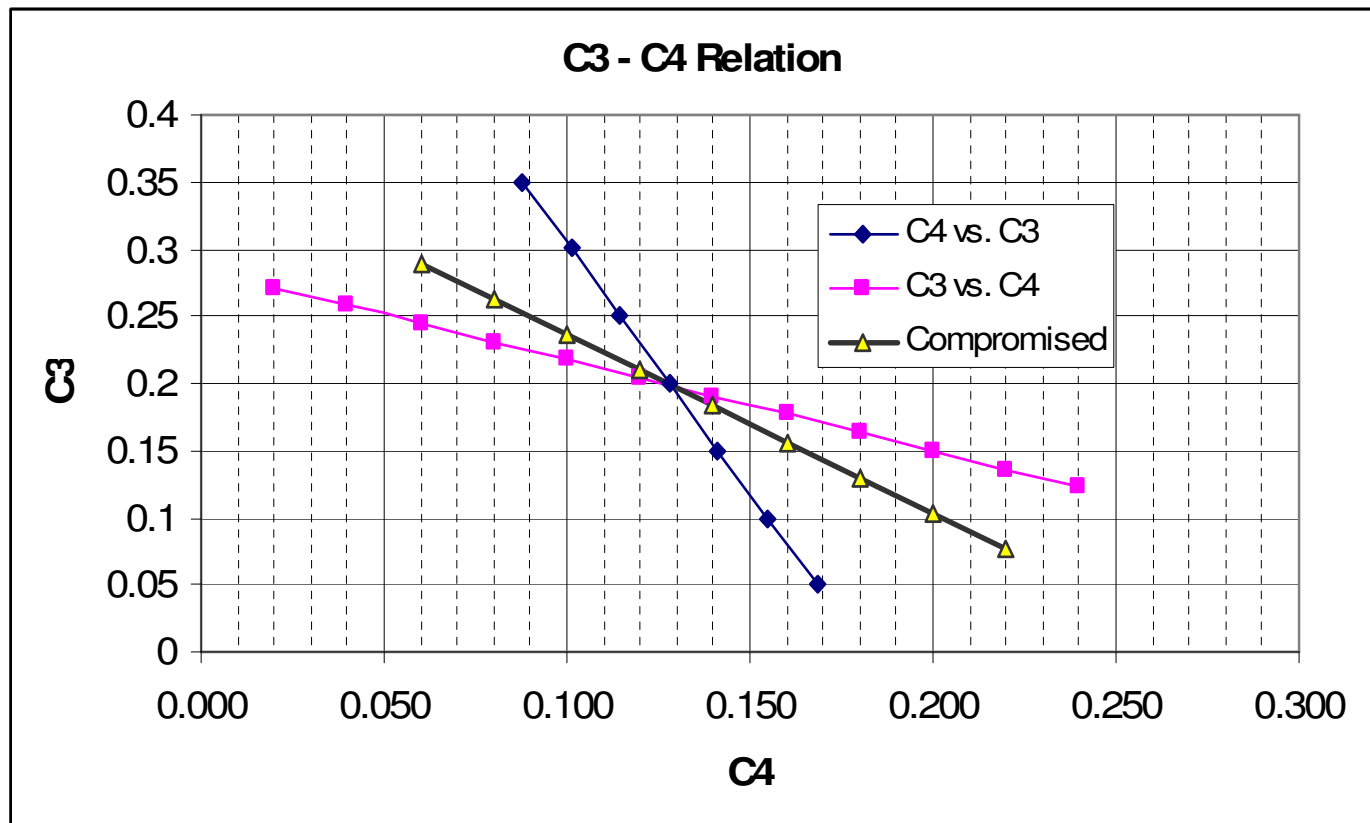

### 2 Problem 1 solution: using average coefficients instead of 0

$$\sigma = C_1 e^{C_2/T} \cdot \varepsilon^{C_3} \cdot u^{C_4}$$

Fit	Learning Coefficient	Fixed Coefficient
FIT2	C1, C2	C3=C3m, C4=C4m
FIT3A	C1, C2, C3	C4=C3m
FIT3B	C1, C2, C4	C3=C4m
FIT4	C1, C2, C3, C4	

## C. Modeling Issues

### 3 Problem 2: C3-C4 dependence downgrades 4-parameter learning

## C. Modeling Issues

### 4 Problem 3: narrow valid range; not valid for strain below 0.05

## C. Modeling Issues

---

### 5 Guided two-parameter Learning: Solution for existing Level 2

- Well-designed C3 and C4 as fixed values, using C1 and C2 as learning parameter
- Totally 6000 sets of C1, C2, C3 and C4 for 2000 model grades, one set per temperature per model grade (as in OSM)
  - Solution to Problem 1, 2, 3 integrated into C3 and C4
- Very few changes for source code

## D. Software Engineering Issues

---

### 1 Development far behind Information Technology industry

- **Software: Client-Server (OpenVMS) vs. Service-Oriented Architecture (SOA)**
- **Hardware: concerns on long-term availability of OpenVMS compatible hardware**
- **System design and data structure in some Level 2 systems**
- **System upgrade**

## D. Software Engineering Issues

---

### 2 Current technologies available for Level 2 (examples)

- **Object-oriented design based on interactive relationship of mill models**
  - **Consistence of data structure and class**
  
- **Web-based Level 2 system and/or remote support**
  - **Example: Mill Diagnosis System (MDS)**
  
- **SOA to integrate old OpenVMS-based Level 2 systems**

## E. Next-Generation Level 2 System

---

### 1 From Mechanical System to Metallurgical System

- **Current Level 2: Mechanical System**
- **Next-Generation Level 2: Metallurgical System**
  - **Retained Strain**
  - **Draft distribution: steel properties improvement**
  - **Phase transformation, hold.**

## E. Next-Generation Level 2 System

---

### 2 Intelligent learning

- **Hybrid solution**
  - **Sufficient empirical models**
  - **Neural network to optimize coefficients in the empirical models**
  
- **Expert system as guideline**

## E. Next-Generation Level 2 System

---

### 2 Uninterrupted upgrade

- **DLL Level**
- **Component Level**
- **Service Level (COM+, SOA, etc.)**
- **Less or No System Shutdown**

---

---

# Thank You
